/note="Vector: pT773-Pac; Site_1: EcoRI; Site_2: NotI;
PolyA-selected mRNA was prepared from unfertilized Xenopus
laevis eggs. The library was constructed in the vector
pT773-Pac as described in Bonaldo, M.F., Lennon, G. and
Soares, M.B. 'Normalization and subtraction: two
approaches to facilitate gene discovery', Genome Research
6:791-806, 1996. The first strand synthesis used a
NotI-dT18 primer; double stranded cDNAs were ligated to
EcoRI adapters, digested with NotI, and directionally
cloned into the NotI and EcoRI-digested pT773-Pac vector.
The library contained approximately 7.2 x 10^5
recombinants, with average insert sizes of 1-1.5 kb."

PolyA-selected mRNA was prepared from unfertilized Xenopus laevis eggs. The library was constructed in the vector p7713-Pac as described in Bonaldo, M.F., Lennon, G. and Soares, M.B. Normalization and subtraction: two approaches to facilitate gene discovery', Genome Research Soares, M.B. Normalization and subtraction: two approaches to facilitate gene discovery', Genome Research 6:791-806, 1996. The first strand synthesis used a NotI-dT18 primer; double stranded cDNAs were ligated to EcoRI adapters, digested with NotI, and directionally cloned into the NotI and EcoRI-disested p7713-pac vector. The library contained approximately 7.2 x 10.5
recombinants, with average insert sizes of 1-1.5 kb."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              bl87hl1.w1 Blackshear/Scares normalized Xenopus egg library Xenopus Aw639842 GI:7397045

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description

            used in conjunction with the non-specific primers given in AAQ79175-77 in the DNA amplification method of the invention. The method comprises mixing a DNA sequence and a primer. DNA polymerase and deoxyrthonuclectides. The DNA is denatured allowing annealing of the primers. The amplification cycle consists of one cycle at a temperature to allow non-specific annealing of non-specific primers, numerous cycles at a temp. to allow specific annealing of specific to hybridise specifically to complementary sequences. This method allows amplification of neighbouring sequences with known sequences, efficiently without cyclisation of the DNA or ligation of
                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This degenerate oligonucleotide, termed CA54, is a primer used in the border rescue of the 16713 gene (see AAA88448) from Arabidopsis thallana embryo-lethal line #16713. DNA flanking the borders of line #16713 was isolated using TAIL PCR. CA54 is 10 of 6 primers (see AAA88451-56) used in combination with 2 sets of nested, T-DNA specific primers for the right border (see AAA88457-59) as well as for the left border (see AAA88460-62) of the T-DNA region of pCSA104.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a transgenic glufosinate tolerant rice plant. The tolerant rice plants are generated by transformation with the Streptomyces hygroscopicus bar gene. This gene encodes the enzyme phosphinothricin acetyl transferase (PAT), which confers resistance to the herbicidal compounds phosphinothricin (also called glufosinate) and blalaphons. The 3' insertion site of the transgene was determined by thermal asymmetric interlaced (TAIL) PCR. The present sequence is the arbitrary degenerate PCR primer, WDB285, used for the TAIL PCR. Glufosinate Locarant rice plants are useful as they give better yields and growth, compared to untransformed plants, after application of a

The essentiality of the genes provides a means of discovering new herbicides. Screening assays for identifying inhibitors that are potential herbicides are provided. The invention is also applied to the development of herbicide tolerant plants, and plant tissues, seeds and cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is that of degenerate primer CA54. Arbitrary degenerate primers LWAD1, CA51, CA52, CA53, CA54 and CA55 (see AAF9051-56) were used to prime Arabidopsis thaliana genomic DNA flanking a Ds transposon insertion. The degenerate primers were used in combination with 2 sets of 3, nested, transposon-specific primers (see AAF90557-62) that were homologous to regions of the Ds elements which lie at the outermost ends of the transposons. A series of low- and high-stringency PCR amplifications were performed using the TAIL-PCR protocol. DNA fragments were produced which corresponded to the genomic DNA that was directly adjacent to
                                                                                                                                                                                           ET1158 gene; GT6839 gene; ET5262 gene; herbicide; screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EX PX PX B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 is used to control seed germination and seedling growth especially to regulate gene products of glbberellin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The plants produced are glbberellin deficient, and have shortened hypocotyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Obtaining transgenic plant useful for controlling seed germination and seedling growth comprises transgene comprising a sequence expressing altered levels of an essential hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers AA299438-42 were used to amplify the soybean AX5 promoter. The amplified sequence is used in the method of the invention. The specification describes methods for the inhibition and control of gibberellic acid levels. Glabberellic acid levels may be inhibited or controlled by use of a chimeric expression construct expressing a RNA or protein which suppresses the gibberellin biosynthetic pathway sequence, diverts substrate from the pathway, or degrades pathway substrates or products. The methods uses copalyl diphosphate synthase, 3beta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a least abeta-hydroxylase polynucleotides to achieve this. The method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Logusch SJ;

The invention relates to a method of generating transgenic plants
that have modified gene activity or nucleic acid structure. The method
involves the cross-fertilisation of two transgenic plant lines to produce
seed, which is then grown to produce a plant. One of the parental plant
lines contains a gene encoding a non-native site-specific nucleic acid
effector molecule under the control of a minimal promoter and operably
linked to an endogenous enhance relement, and the other contains a
recognition sequence to which the nucleic acid effector molecule can
crecognition activator, methylation enzyme, repressor, gyrase,
crecognitional activator, methylation enzyme, or single or double
transcriptional activator, methylation enzyme, or single or double
creasing the nucleic acid effector molecule accordinate
creasing plant lines are crossed, in which a transgenic plant lines are crossed, in which a transgenic plant lines are crossed, in which a transgenic cross-breed plant,
creasing of the nucleic acid effector molecule to the recognition sequence
specificity of gene expression, the timing of gene expression, the tissue
creasing a desired phenotype can then be selected. The method of the
invention can be used to generate transgenic plants, including Gramineae
creasing maize, rice, barley, rye, oats, sugarcane), solanaceae
creasing maize, rice, barley, rye, oats, sugarcane), solanaceae
creasing mapping of T-DNA and Ds element insertion elements in
creasing mapping of T-DNA and bs element insertion elements in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility ene, at a specific location in the Brassica genome. Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is degenerate PCR primer MDB285 used to generate right (5') and left (3') border flanking region of elite event MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transgenic Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -

The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates also relates to the protein encoded by pollinosis-associated gene 581; to expression constructs and host cells comprising pollinosis-associated gene 581 nucleic acids; pollinosis-associated gene 581 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 581 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 581 nucleic acids; The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 581 in pollen
The present invention provides tapetum-specific promoters which can be used to create artificial male sterility (AMS) systems in plants. These are useful in agriculture as they enable the production of plants with increased yield and greater disease resistance. They also result in uniform offspring, which have the same germination time, height of growth, susceptibility to disease, flowering time etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gunji S;

antigen-stimulated T-cells in the presence of a test compound relative to a control Pollinosis-associated gene 581 is useful in the diagnosis of allergic diseases and in the screening of Grug candidates for the treatment of such diseases. The present sequence represents a hybridisation probe used in human pollinosis-associated gene 581

Parallel detection of the methylation pattern of many genomic DNA regions, useful for detecting aberrant methylation, includes multiple amplification of chemically modified DNA.

Disclosure; Page 63; 63pp; German.

This invention describes a novel method for the parallel detection of the methylation status of genomic DNA (I) which involves a (I) sample being treated chemically to convert 5-unmethylated cytosine to uracil, thymidine or some other base having hybridization behavior different from that of C, then amplifying simultaneously at least 10 different fragments of fewer than 2 kb) using synthetic oligonucleotide (ON) primers. These primers are based on regulatory, transcribed and/or translated segments primers are based on regulatory, transcribed and/or translated segments present in the sample after chemical treatment. The sequence context of all, or some, of the CpG and CDNG motifs in the amplified products is then determined. The method is used to detect aberrant methylation parterns in the genome, these are implicated in regulation of transcription, genetic imprinting and tumorigenesis. Many target regions in the genome can be analyzed simultaneously and it is not essential to the application of particular segments of analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and it is not essential to the analyzed simultaneously and its essential to the analyzed simultaneously and i (e.g. promoters and exons).

The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length
                                                                                                                                                                                                                                                 expressed sequence tag; secreted protein; cDNA isolation; chromosome mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 335 BP; 71 A; 75 C; 89 G; 89 T; 11 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   human secreted proteins, and encode the proteins given in AAY12681 to human secreted proteins, and encode the proteins given in AAY12681 to AAY12913, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for products for diagnosis and therapy. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, reproductive hormone activity, tissue growth regulating activity, reproductive hormone activity, tissue growth regulating activity, anti-inflammatory activity, tumour inhibition activity or other activity, anti-inflammatory activity, tumour inhibition activity or other activity and chromosome mapping products can be used in forensic, gene therapy and chromosome mapping promoter sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a cell.

AAX20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the

```
The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is right (5') border flanking region of elite event MS-B2.
                                                                                                                                                                                                                                                                            Transgentc Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -

Patent No. 5545546

GENERAL INFORMATION:
APPLICANT: ALLEN, Rebecca L.
APPLICANT: LONSDALE, David M.
ITLE OF INVENTION: A POllen-Specific Promoter From Maize NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSEE: Foley & Lardner
STREET: 3000 K Street, N.W., Suite 500
CITY: Washington Street, N.W., Suite 500
STATE: D.C.
COUNTY: USA
LIP: 20007-5109
COMPUTER: READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: THE PC Compatible
OPERATING SYSTEM: DC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
CLASSIFICATION NUMBER: US/08/377,228
FILING DATE: 09-NOV-1993
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 08/149,695
FILING DATE: 09-NOV-1993

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
xhoi; Plants were grown in an aeroponic chamber for 14 days on ntrogen-rich medium followed by 3 days on N-free medium. RNA was extracted from root tips (1-3 cm). cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into Uni-zapXR vector from Strategene and packaged using Glapack Gold packaging extracts. Plasmids containing cDNA inserts were mass-excised from phage stocks using ExAssit helper phage and propagated in SOLR cells. Clone ordering and sequencing was performed by the Centre National de Sequencage (Genoscope, Evry, France).*

RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.lastate.edu' and follow the links for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Locates Locate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       'RescueMu.' Grid G was grown at Stanford in 2000. DNA was setracted from leaf punches, double digested using BamHI and Balli, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The sequence contained an oligo-dr track that was present in the oligo-drougleotide that was used to prime the synthesis of first oligo-ucloctide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Notl site and the oligo-dr track served to identify it as a clone from the retina tissue cDNA Library Preparation: M.B. Soares Lab Clone distribution: Researchers may obtain BMAP cDNA clones from RESEARCH GENETICS. It should be noted that Bento Soares is generating a small number of additional specialized non-redundant arrays of BMAP cDNAs whose availability will be considered under appropriate and Seg primer: MIS Forward
POLNA-Yes.
